Top Level, the new series of visual level gauges with 76, 127 and 254 mm CC distances.

LV series visual level gauges can be combined with one or more electric contacts

## QUALITY AND ORIGINALITY ON THE LEVEL-INDICATOR MARKET

*Interview with Daniele Giacomello, the owner of FRATELLI GIACOMELLO*

### How has the company developed since it was first founded?

The F.lli Giacomello snc company was set up in 1985 as a family-run concern, with the idea of being able to offer quality and originality to the level-indicator market. The new ideas that it has launched onto the market in terms of flexibility and application solutions are manifold: starting with its "Rapid Level" series, and going as far as its new range of "Top Level" visual level gauges. Thanks to the deep-seated desire to reach the maxi-

mum levels of specialisation within the level-indicator industry, the F.lli Giacomello company, by collaborating with some of the outstanding customers on the market, has managed to create its own sales network all over the world. Despite being aware of how much more there is still to be done to improve and consolidate its own position in fluid control circles, the F.lli Giacomello company is now a successful company, capable of meeting all customer-requirements: level gauges that can be modulated so allowing for

the utmost in warehouse flexibility, level gauges that can be modified by the customers themselves, and one-off level gauges with an excellent quality-price ratio.

### What does the production range consist of?

The liquid level gauges can be monitored with the RL and LV series or with classic floating level switches, also with 4-20 mA output. The Rapid Level gauges are electromagnetic level indicators that are supplied as a kit and their main feature is that of being able to

reach the control value simply by cutting the control rod with a standard pipe-cutter.

The visual level gauges in the LV series make it possible to clearly and accurately check the level of liquid at all times. The principle that is applied here is that of communicating vessels, where the liquid passes through the level by means of hollow screws, showing the user the level reached by the liquid in the tank. A wide range of accessories enables these level indicators to carry out the most varied of controls on the liquid. With the FLU/P

flow switches the flow rate is constantly under control and there is the possibility to check for any drops in liquid levels. Temperature control is not a problem either thanks to the thermometers, thermostats and heat-resistors that are fitted in different products, from plugs to level switches.

### What changes have been made over the years in terms of both products and services?

Over the last few years, the product range has been stepped up with the intro-

duction of two new series of level indicators: the Mini Genius (MG) and Top Level (TL) series have been added to the initial RL and LV series which are practical to use, sturdy and inexpensive. The MG series is the result of experience dating back more than 20 years; a happy blend of troubleshooting and all-round use... nothing is ever left to chance. For a retailer this is the product, more than any other, that meets the requirements of every individual customer.

Extreme versatility and reliability are the main characteristics of these "small yet impressive" level switches.

The TL series is made using a special polymer that is almost as transparent as glass. Visibility is 100% from both the front and the side as the level, extremely tough thanks to both the thickness and quality of the materials used, does not need any metal protectors. The Top Level series, besides a visual indication of the level of liquid, can also offer a low level electric signal and, in addition, it can monitor the temperature of the liquid using a bi-metal thermostat or a PT100.

The next product to be launched onto the market will be the new series of pressure switches that the F.lli Giacomello company has almost finished work-

ing on and which will close the circle, or rather total process control. What's more the new [www.fratelligiacomello.it](http://www.fratelligiacomello.it) web site was designed with the precise aim of being truly close to those people who use our products and, therefore, on the site they can find all the information they need not only on how to make the right product choice but also on how to install and use it properly.

**What are the main application industries for your products?**

The products made by the F.lli Giacomello company are used in practically all industrial circles where there is a need for safe and reliable level, capacity and temperature control. Anyone who buys a F.lli Giacomello product is sure of getting a product that was designed and made in accordance with directives that are an absolute guarantee of quality and reliability. Working to high quality standards has always been our decision, quality that is meant not only as technologically advanced production, but also ... and may I add above all ... as complete satisfaction of both customer-requirements and market demand.
