

Rapid Level, not just a level

For dirty liquids and more

The Rapid Level series has always been the unmistakable brand of F.lli Giacomello, appreciated all over the world for its flexibility, safety and ease of use.

RAPID LEVEL FEATURES:

- It can be used for dirty liquids, water, petroleum, coolant oils and tolerates the presence of metal particles, including ferrous ones, thanks to a float that does not carry a magnet and is integral with the rod.
- Ensures total safety, determined by the fact that the electrical part is totally separated on the side of the tank and perfectly sealed with respect to the external side, by means of ultrasonic welding and resin coating of the pins.
- The nylon-glass body is very sturdy under the mechanical aspect, extremely resistant under the chemical profile and ideal as an insulating container for the Reed contacts.
- It is suitable for controlling heights up to 1000 mm, but with a simple modification of the float and the use of a different tube, it can control up to 3000 mm.
- The desired length can be obtained simply by cutting the steel rod with a simple pipe cutter; or the switching point can be varied using a float with a through hole that allows, whenever there is a need, to change the control point of the desired liquid.

The Rapid Level series offers different types of connections, including flanges, 1 "Gas and 1" 1/4 Gas and NPT threaded connections.

It is possible to have SPST or SPDT contacts and control 1 or 2 intervention points separately. Ideal for the user, as well as for the retailer who can keep only one level in stock and change the intervention point in a few moments when needed.

The RL series has expanded considerably over the years, offering a very complete range:

- vertical levels with 1 or 2 rods,
- lateral levels,
- AISI 316 levels for aggressive liquids,
- levels for high temperatures up to 200 ° C,
- pneumatic levels where the current is not allowed,
- visual levels to put on the lid of the tanks.
